...relative to the corresponding Regional Screening Level (RSL). RSLs were initially developed by Region 3 but are presently developed by DOE's Oak Ridge National Laboratory (ORNL) under an Interagency Agreement as an update to risk-based screening levels/preliminary remediation goals developed by Regions 3, 6 and 9. The RSLs are calculated using the latest toxicity values, default exposure assumptions and physical and chemical properties and are used to screen contaminants of concern and develop preliminary remediation goals at hazardous waste sites.
